Exercise 11.3

## Question 1:

In each of the following cases, determine the direction cosines of the normal to the plane and the distance from the origin.

(a)z = 2 (b) x + y + z = 1

(c) 
$$2x + 3y - z = 5$$
 (d)  $5y + 8 = 0$ 

Answer

(a) The equation of the plane is z = 2 or 0x + 0y + z = 2 ... (1) The direction ratios of normal are 0, 0, and 1.

$$\sqrt{0^2 + 0^2 + 1^2} = 1$$

Dividing both sides of equation (1) by 1, we obtain

$$0.x + 0.y + 1.z = 2$$

This is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of the perpendicular drawn from the origin.

Therefore, the direction cosines are 0, 0, and 1 and the distance of the plane from the origin is 2 units.

**(b)**  $x + y + z = 1 \dots (1)$ 

The direction ratios of normal are 1, 1, and 1.

$$\sqrt{(1)^2 + (1)^2 + (1)^2} = \sqrt{3}$$

Dividing both sides of equation (1) by  $\sqrt{3}$  , we obtain

$$\frac{1}{\sqrt{3}}x + \frac{1}{\sqrt{3}}y + \frac{1}{\sqrt{3}}z = \frac{1}{\sqrt{3}} \qquad \dots (2)$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

Therefore, the direction cosines of the normal are  $\frac{1}{\sqrt{3}}$ ,  $\frac{1}{\sqrt{3}}$ , and  $\frac{1}{\sqrt{3}}$  and the distance of normal from the origin is  $\frac{1}{\sqrt{3}}$  units.

(c)  $2x + 3y - z = 5 \dots (1)$ 

The direction ratios of normal are 2, 3, and -1.

$$\therefore \sqrt{(2)^{2} + (3)^{2} + (-1)^{2}} = \sqrt{14}$$

Dividing both sides of equation (1) by  $\sqrt{14}$  , we obtain

$$\frac{2}{\sqrt{14}}x + \frac{3}{\sqrt{14}}y - \frac{1}{\sqrt{14}}z = \frac{5}{\sqrt{14}}$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

Therefore, the direction cosines of the normal to the plane are  $\frac{2}{\sqrt{14}}$ ,  $\frac{3}{\sqrt{14}}$ , and  $\frac{-1}{\sqrt{14}}$  and

the distance of normal from the origin is  $\frac{5}{\sqrt{14}}$  units. (d) 5y + 8 = 0

$$\Rightarrow 0x - 5y + 0z = 8 \dots (1)$$

The direction ratios of normal are 0, -5, and 0.

$$\therefore \sqrt{0 + \left(-5\right)^2 + 0} = 5$$

Dividing both sides of equation (1) by 5, we obtain

$$-y = \frac{8}{5}$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

Therefore, the direction cosines of the normal to the plane are 0, -1, and 0 and the

distance of normal from the origin is 
$$\frac{8}{5}$$
 units.

Question 2:

Find the vector equation of a plane which is at a distance of 7 units from the origin and

normal to the vector 
$$3\hat{i} + 5\hat{j} - 6\hat{k}$$
.

Answer

The normal vector is,  $\vec{n} = 3\hat{i} + 5\hat{j} - 6\hat{k}$ 

$$\therefore \hat{n} = \frac{\vec{n}}{\left|\vec{n}\right|} = \frac{3\hat{i} + 5\hat{j} - 6\hat{k}}{\sqrt{(3)^2 + (5)^2 + (6)^2}} = \frac{3\hat{i} + 5\hat{j} - 6\hat{k}}{\sqrt{70}}$$

It is known that the equation of the plane with position vector  $\vec{r}$  is given by,  $\vec{r} \cdot \hat{n} = d$ 

$$\Rightarrow \hat{r} \cdot \left(\frac{3\hat{i} + 5\hat{j} - 6\hat{k}}{\sqrt{70}}\right) = 7$$

This is the vector equation of the required plane.

## Question 3:

Find the Cartesian equation of the following planes:

(a) 
$$\vec{r} \cdot (\hat{i} + \hat{j} - \hat{k}) = 2$$
 (b)  $\vec{r} \cdot (2\hat{i} + 3\hat{j} - 4\hat{k}) = 1$   
(c)  $\vec{r} \cdot [(s - 2t)\hat{i} + (3 - t)\hat{j} + (2s + t)\hat{k}] = 15$   
Answer

(a) It is given that equation of the plane is

$$\vec{r} \cdot \left(\hat{i} + \hat{j} - \hat{k}\right) = 2 \qquad \dots (1)$$

For any arbitrary point P (x, y, z) on the plane, position vector  $\vec{r}$  is given by,

$$\vec{r} = x\hat{i} + y\hat{j} - z\hat{k}$$

Substituting the value of  $\vec{r}$  in equation (1), we obtain

$$(x\hat{i} + y\hat{j} - z\hat{k}) \cdot (\hat{i} + \hat{j} - \hat{k}) = 2$$
  
 $\Rightarrow x + y - z = 2$ 

This is the Cartesian equation of the plane.

**(b)** 
$$\vec{r} \cdot \left(2\hat{i} + 3\hat{j} - 4\hat{k}\right) = 1$$
 ...(1)

For any arbitrary point P (x, y, z) on the plane, position vector  $\vec{r}$  is given by,

$$\vec{r} = x\hat{i} + y\hat{j} - z\hat{k}$$

Substituting the value of  $\vec{r}$  in equation (1), we obtain

$$(x\hat{i} + y\hat{j} + z\hat{k}) \cdot (2\hat{i} + 3\hat{j} - 4\hat{k}) = 1 \Rightarrow 2x + 3y - 4z = 1$$

This is the Cartesian equation of the plane.

(c) 
$$\vec{r} \cdot \left[ (s-2t)\hat{i} + (3-t)\hat{j} + (2s+t)\hat{k} \right] = 15$$
 ...(1)

For any arbitrary point P (x, y, z) on the plane, position vector  $\vec{r}$  is given by,

$$\vec{r} = x\hat{i} + y\hat{j} - z\hat{k}$$

Substituting the value of  $\vec{r}$  in equation (1), we obtain

$$(x\hat{i} + y\hat{j} - z\hat{k}) \cdot [(s - 2t)\hat{i} + (3 - t)\hat{j} + (2s + t)\hat{k}] = 15 \Rightarrow (s - 2t)x + (3 - t)y + (2s + t)z = 15$$

This is the Cartesian equation of the given plane.

## **Question 4:**

In the following cases, find the coordinates of the foot of the perpendicular drawn from the origin.

(a) 
$$2x+3y+4z-12=0$$
 (b)  $3y+4z-6=0$ 

(c) 
$$x + y + z = 1$$
 (d)  $5y + 8 = 0$ 

Answer

(a) Let the coordinates of the foot of perpendicular P from the origin to the plane be  $(x_1, y_1, z_1)$ .

2x + 3y + 4z - 12 = 0

$$\Rightarrow 2x + 3y + 4z = 12 \dots (1)$$

The direction ratios of normal are 2, 3, and 4.

$$\therefore \sqrt{(2)^2 + (3)^2 + (4)^2} = \sqrt{29}$$

Dividing both sides of equation (1) by  $\sqrt{29}$  , we obtain

$$\frac{2}{\sqrt{29}}x + \frac{3}{\sqrt{29}}y + \frac{4}{\sqrt{29}}z = \frac{12}{\sqrt{29}}$$

This equation is of the form lx + my + nz = d, where *l*, *m*, *n* are the direction cosines of normal to the plane and *d* is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by

Therefore, the coordinates of the foot of the perpendicular are

$$\left(\frac{2}{\sqrt{29}},\frac{12}{\sqrt{29}},\frac{3}{\sqrt{29}},\frac{12}{\sqrt{29}},\frac{4}{\sqrt{29}},\frac{12}{\sqrt{29}}\right)$$
 i.e.,  $\left(\frac{24}{29},\frac{36}{49},\frac{48}{29}\right)$ .

(b) Let the coordinates of the foot of perpendicular P from the origin to the plane be  $(x_1, x_2)$ 

$$y_1, z_1$$
).  
 $3y + 4z - 6 = 0$ 

$$\Rightarrow 0x + 3y + 4z = 6...(1)$$

The direction ratios of the normal are 0, 3, and 4.

$$\therefore \sqrt{0+3^2+4^2} = 5$$

Dividing both sides of equation (1) by 5, we obtain

$$0x + \frac{3}{5}y + \frac{4}{5}z = \frac{6}{5}$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by

(*Id*, *md*, *nd*).

Therefore, the coordinates of the foot of the perpendicular are

$$\left(0, \frac{3}{5}, \frac{6}{5}, \frac{4}{5}, \frac{6}{5}\right)$$
 i.e.,  $\left(0, \frac{18}{25}, \frac{24}{25}\right)$ .

(c) Let the coordinates of the foot of perpendicular P from the origin to the plane be  $(x_1, x_2)$ 

$$y_1, z_1).$$

$$x + y + z = 1 \dots (1)$$

The direction ratios of the normal are 1, 1, and 1.

$$\therefore \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$$

Dividing both sides of equation (1) by  $\sqrt{3}$  , we obtain

$$\frac{1}{\sqrt{3}}x + \frac{1}{\sqrt{3}}y + \frac{1}{\sqrt{3}}z = \frac{1}{\sqrt{3}}$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by

(*Id*, *md*, *nd*).

Therefore, the coordinates of the foot of the perpendicular are

$$\left(\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}\right)$$
 i.e.,  $\left(\frac{1}{3},\frac{1}{3},\frac{1}{3}\right)$ .

(d) Let the coordinates of the foot of perpendicular P from the origin to the plane be  $(x_1, y_1, z_1)$ .

$$5y + 8 = 0$$

$$\Rightarrow 0x - 5y + 0z = 8 \dots (1)$$

The direction ratios of the normal are 0, -5, and 0.

$$\therefore \sqrt{0 + \left(-5\right)^2 + 0} = 5$$

Dividing both sides of equation (1) by 5, we obtain

$$-y = \frac{8}{5}$$

This equation is of the form lx + my + nz = d, where l, m, n are the direction cosines of normal to the plane and d is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by

Therefore, the coordinates of the foot of the perpendicular are

$$\left(0,-1\left(\frac{8}{5}\right),0\right)$$
 i.e.,  $\left(0,-\frac{8}{5},0\right)$ .

## **Question 5:**

Find the vector and Cartesian equation of the planes

(a) that passes through the point (1, 0, –2) and the normal to the plane is  $\hat{i}+\hat{j}-\hat{k}$  .

(b) that passes through the point (1, 4, 6) and the normal vector to the plane is

$$\hat{i} - 2\hat{j} + \hat{k}$$

Answer

(a) The position vector of point (1, 0, -2) is 
$$\vec{a} = \hat{i} - 2\hat{k}$$

The normal vector  $\vec{N}$  perpendicular to the plane is  $\vec{N}=\hat{i}+\hat{j}-\hat{k}$ 

The vector equation of the plane is given by,  $(\vec{r} - \vec{a}).\vec{N} = 0$ 

$$\Rightarrow \left[\vec{r} - \left(\hat{i} - 2\hat{k}\right)\right] \cdot \left(\hat{i} + \hat{j} - \hat{k}\right) = 0 \qquad \dots(1)$$

 $\vec{r}$  is the position vector of any point P (x, y, z) in the plane.

$$\therefore \vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$$

Therefore, equation (1) becomes

$$\begin{bmatrix} \left(x\hat{i}+y\hat{j}+z\hat{k}\right)-\left(\hat{i}-2\hat{k}\right)\end{bmatrix} \cdot \left(\hat{i}+\hat{j}-\hat{k}\right) = 0$$
  

$$\Rightarrow \begin{bmatrix} (x-1)\hat{i}+y\hat{j}+(z+2)\hat{k}\end{bmatrix} \cdot \left(\hat{i}+\hat{j}-\hat{k}\right) = 0$$
  

$$\Rightarrow (x-1)+y-(z+2)=0$$
  

$$\Rightarrow x+y-z-3=0$$
  

$$\Rightarrow x+y-z=3$$

This is the Cartesian equation of the required plane.

(**b**) The position vector of the point (1, 4, 6) is  $\vec{a} = \hat{i} + 4\hat{j} + 6\hat{k}$ 

The normal vector  $\vec{N}$  perpendicular to the plane is  $\vec{N} = \hat{i} - 2\hat{j} + \hat{k}$ 

The vector equation of the plane is given by,  $(\vec{r} - \vec{a}).\vec{N} = 0$ 

$$\Rightarrow \left[\vec{r} - \left(\hat{i} + 4\hat{j} + 6\hat{k}\right)\right] \cdot \left(\hat{i} - 2\hat{j} + \hat{k}\right) = 0 \qquad \dots(1)$$

 $\vec{r}$  is the position vector of any point P (x, y, z) in the plane.

$$\therefore \vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$$

Therefore, equation (1) becomes

$$\begin{bmatrix} \left(x\hat{i}+y\hat{j}+z\hat{k}\right) - \left(\hat{i}+4\hat{j}+6\hat{k}\right) \end{bmatrix} \cdot \left(\hat{i}-2\hat{j}+\hat{k}\right) = 0 \\ \Rightarrow \begin{bmatrix} (x-1)\hat{i}+(y-4)\hat{j}+(z-6)\hat{k} \end{bmatrix} \cdot \left(\hat{i}-2\hat{j}+\hat{k}\right) = 0 \\ \Rightarrow (x-1)-2(y-4)+(z-6) = 0 \\ \Rightarrow x-2y+z+1=0 \end{bmatrix}$$

This is the Cartesian equation of the required plane.

Question 6:

Find the equations of the planes that passes through three points.

(a) The given points are A (1, 1, -1), B (6, 4, -5), and C (-4, -2, 3).

 $\begin{vmatrix} 1 & 1 & -1 \\ 6 & 4 & -5 \\ -4 & -2 & 3 \end{vmatrix} = (12 - 10) - (18 - 20) - (-12 + 16)$ = 2 + 2 - 4= 0

Since A, B, C are collinear points, there will be infinite number of planes passing through the given points.

**(b)** The given points are A (1, 1, 0), B (1, 2, 1), and C (-2, 2, -1).

$$\begin{vmatrix} 1 & 1 & 0 \\ 1 & 2 & 1 \\ -2 & 2 & -1 \end{vmatrix} = (-2-2) - (2+2) = -8 \neq 0$$

Therefore, a plane will pass through the points A, B, and C.

It is known that the equation of the plane through the points,  $(x_1, y_1, z_1)$ ,  $(x_2, y_2, z_2)$ , and

$$\begin{pmatrix} x_3, y_3, z_3 \end{pmatrix}, \text{ is} \begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} x - 1 & y - 1 & z \\ 0 & 1 & 1 \\ -3 & 1 & -1 \end{vmatrix} = 0 \Rightarrow (-2)(x - 1) - 3(y - 1) + 3z = 0 \Rightarrow -2x - 3y + 3z + 2 + 3 = 0 \Rightarrow -2x - 3y + 3z = -5 \Rightarrow 2x + 3y - 3z = 5$$

This is the Cartesian equation of the required plane.

Question 7:

Find the intercepts cut off by the plane 2x + y - z = 5Answer

2x + y - z = 5 ...(1)

Dividing both sides of equation (1) by 5, we obtain

$$\frac{2}{5}x + \frac{y}{5} - \frac{z}{5} = 1$$
  
$$\Rightarrow \frac{x}{5} + \frac{y}{5} + \frac{z}{-5} = 1 \qquad \dots (2)$$

It is known that the equation of a plane in intercept form is  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ , where *a*, *b*, *c* are the intercepts cut off by the plane at *x*, *y*, and *z* axes respectively. Therefore, for the given equation,

$$a = \frac{5}{2}, b = 5$$
, and  $c = -5$ 

Thus, the intercepts cut off by the plane are  $\frac{5}{2}$ , 5, and -5.

## **Question 8:**

Find the equation of the plane with intercept 3 on the *y*-axis and parallel to ZOX plane.

Answer

The equation of the plane ZOX is

y = 0

Any plane parallel to it is of the form, y = a

Since the *y*-intercept of the plane is 3,

∴ *a* = 3

Thus, the equation of the required plane is y = 3

```
Question 9:
```

Find the equation of the plane through the intersection of the planes

3x - y + 2z - 4 = 0 and x + y + z - 2 = 0 and the point (2, 2, 1)

# Answer

The equation of any plane through the intersection of the planes,

$$3x - y + 2z - 4 = 0 \text{ and } x + y + z - 2 = 0, \text{ is}$$
  
(3x - y + 2z - 4) + \alpha (x + y + z - 2) = 0, where \alpha \in R ...(1)

The plane passes through the point (2, 2, 1). Therefore, this point will satisfy equation (1).

$$\therefore (3 \times 2 - 2 + 2 \times 1 - 4) + \alpha (2 + 2 + 1 - 2) = 0$$
$$\Rightarrow 2 + 3\alpha = 0$$
$$\Rightarrow \alpha = -\frac{2}{3}$$

Substituting 
$$\alpha = -\frac{2}{3}$$
 in equation (1), we obtain  
 $(3x - y + 2z - 4) - \frac{2}{3}(x + y + z - 2) = 0$   
 $\Rightarrow 3(3x - y + 2z - 4) - 2(x + y + z - 2) = 0$   
 $\Rightarrow (9x - 3y + 6z - 12) - 2(x + y + z - 2) = 0$   
 $\Rightarrow 7x - 5y + 4z - 8 = 0$ 

This is the required equation of the plane.

**Question 10:** 

Find the vector equation of the plane passing through the intersection of the planes

$$\vec{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) = 7$$
,  $\vec{r} \cdot (2\hat{i} + 5\hat{j} + 3\hat{k}) = 9$  and through the point (2, 1, 3)  
Answer

The equations of the planes are  $\vec{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) = 7$  and  $\vec{r} \cdot (2\hat{i} + 5\hat{j} + 3\hat{k}) = 9$   $\Rightarrow \vec{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) - 7 = 0$  ...(1)  $\vec{r} \cdot (2\hat{i} + 5\hat{j} + 3\hat{k}) - 9 = 0$  ...(2)

The equation of any plane through the intersection of the planes given in equations (1) and (2) is given by,

$$\left[\vec{r}\cdot\left(2\hat{i}+2\hat{j}-3\hat{k}\right)-7\right]+\lambda\left[\vec{r}\cdot\left(2\hat{i}+5\hat{j}+3\hat{k}\right)-9\right]=0\,\text{, where }\lambda\in R$$

#### Page 31 of 58

$$\vec{r} \cdot \left[ \left( 2\hat{i} + 2\hat{j} - 3\hat{k} \right) + \lambda \left( 2\hat{i} + 5\hat{j} + 3\hat{k} \right) \right] = 9\lambda + 7$$
  
$$\vec{r} \cdot \left[ \left( 2 + 2\lambda \right)\hat{i} + \left( 2 + 5\lambda \right)\hat{j} + \left( 3\lambda - 3 \right)\hat{k} \right] = 9\lambda + 7 \qquad \dots (3)$$

The plane passes through the point (2, 1, 3). Therefore, its position vector is given by,  $\vec{r} = 2\hat{i} + 2\hat{j} + 3\hat{k}$ 

Substituting in equation (3), we obtain

$$\begin{aligned} &\left(2\hat{i}+\hat{j}-3\hat{k}\right) \cdot \left[\left(2+2\lambda\right)\hat{i}+\left(2+5\lambda\right)\hat{j}+\left(3\lambda-3\right)\hat{k}\right] = 9\lambda+7\\ \Rightarrow &\left(2+2\lambda\right)+\left(2+5\lambda\right)+\left(3\lambda-3\right) = 9\lambda+7\\ \Rightarrow &18\lambda-3 = 9\lambda+7\\ \Rightarrow &9\lambda = 10\\ \Rightarrow &\lambda = \frac{10}{9}\end{aligned}$$

Substituting 
$$\lambda = \frac{10}{9}$$
 in equation (3), we obtain  
 $\vec{r} \cdot \left(\frac{38}{9}\hat{i} + \frac{68}{9}\hat{j} + \frac{3}{9}\hat{k}\right) = 17$   
 $\Rightarrow \vec{r} \cdot \left(38\hat{i} + 68\hat{j} + 3\hat{k}\right) = 153$   
This is the vector equation of the required plane.

**Question 11:** 

Find the equation of the plane through the line of intersection of the planes

x + y + z = 1 and 2x + 3y + 4z = 5 which is perpendicular to the plane x - y + z = 0Answer

The equation of the plane through the intersection of the planes, x + y + z = 1 and

$$2x + 3y + 4z = 5, \text{ is}$$
  
(x + y + z - 1) +  $\lambda$ (2x + 3y + 4z - 5) = 0  
 $\Rightarrow$  (2 $\lambda$  + 1)x + (3 $\lambda$  + 1)y + (4 $\lambda$  + 1)z - (5 $\lambda$  + 1) = 0 ...(1)

The direction ratios,  $a_1$ ,  $b_1$ ,  $c_1$ , of this plane are  $(2\lambda + 1)$ ,  $(3\lambda + 1)$ , and  $(4\lambda + 1)$ .

The plane in equation (1) is perpendicular to x - y + z = 0

Its direction ratios,  $a_2$ ,  $b_2$ ,  $c_2$ , are 1, -1, and 1.

Since the planes are perpendicular,

$$a_1a_2 + b_1b_2 + c_1c_2 = 0$$
  

$$\Rightarrow (2\lambda + 1) - (3\lambda + 1) + (4\lambda + 1) = 0$$
  

$$\Rightarrow 3\lambda + 1 = 0$$
  

$$\Rightarrow \lambda = -\frac{1}{3}$$

Substituting  $\lambda = -\frac{1}{3}$  in equation (1), we obtain  $\frac{1}{3}x - \frac{1}{3}z + \frac{2}{3} = 0$  $\Rightarrow x - z + 2 = 0$ 

This is the required equation of the plane.

### **Question 12:**

Find the angle between the planes whose vector equations are

$$\vec{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) = 5 \text{ and } \vec{r} \cdot (3\hat{i} - 3\hat{j} + 5\hat{k}) = 3$$

### Answer

The equations of the given planes are  $\vec{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) = 5$  and  $\vec{r} \cdot (3\hat{i} - 3\hat{j} + 5\hat{k}) = 3$ 

It is known that if  $\vec{n}_1$  and  $\vec{n}_2$  are normal to the planes,  $\vec{r} \cdot \vec{n}_1 = d_1$  and  $\vec{r} \cdot \vec{n}_2 = d_2$ , then the angle between them, Q, is given by,

$$\cos Q = \frac{\left| \vec{n}_{1} \cdot \vec{n}_{2} \right|}{\left| \vec{n}_{1} \right| \left| \vec{n}_{2} \right|} \qquad \dots (1)$$

Here,  $\vec{n}_1 = 2\hat{i} + 2\hat{j} - 3\hat{k}$  and  $\vec{n}_2 = 3\hat{i} - 3\hat{j} + 5\hat{k}$ 

$$\therefore \vec{n}_1 \cdot \vec{n}_2 = (2\hat{i} + 2\hat{j} - 3\hat{k})(3\hat{i} - 3\hat{j} + 5\hat{k}) = 2.3 + 2.(-3) + (-3).5 = -15$$
$$|\vec{n}_1| = \sqrt{(2)^2 + (2)^2 + (-3)^2} = \sqrt{17}$$
$$|\vec{n}_2| = \sqrt{(3)^2 + (-3)^2 + (5)^2} = \sqrt{43}$$

Substituting the value of  $\vec{n} \cdot \vec{n}_2$ ,  $|\vec{n}_1|$  and  $|\vec{n}_2|$  in equation (1), we obtain

$$\cos Q = \left| \frac{-15}{\sqrt{17} \cdot \sqrt{43}} \right|$$
$$\Rightarrow \cos Q = \frac{15}{\sqrt{731}}$$
$$\Rightarrow \cos Q^{-1} = \left( \frac{15}{\sqrt{731}} \right)$$

### Question 13:

In the following cases, determine whether the given planes are parallel or perpendicular, and in case they are neither, find the angles between them.

- (a) 7x+5y+6z+30=0 and 3x-y-10z+4=0
- (b) 2x + y + 3z 2 = 0 and x 2y + 5 = 0
- (c) 2x-2y+4z+5=0 and 3x-3y+6z-1=0
- (d) 2x y + 3z 1 = 0 and 2x y + 3z + 3 = 0
- (e) 4x+8y+z-8=0 and y+z-4=0

## Answer

The direction ratios of normal to the plane,  $L_1: a_1x + b_1y + c_1z = 0$ , are  $a_1, b_1, c_1$  and

$$L_2: a_1x + b_2y + c_2z = 0$$
 are  $a_2, b_2, c_2$ 

$$L_1 \parallel L_2$$
, if  $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$   
 $L_1 \perp L_2$ , if  $a_1a_2 + b_1b_2 + c_1c_2 = 0$ 

The angle between  $L_1$  and  $L_2$  is given by,

$$Q = \cos^{-1} \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2 \cdot \sqrt{a_2^2 + b_2^2 + c_2^2}}}$$

(a) The equations of the planes are 7x + 5y + 6z + 30 = 0 and 3x - y - 10z + 4 = 0Here,  $a_1 = 7$ ,  $b_1 = 5$ ,  $c_1 = 6$ 

i

$$a_2 = 3, b_2 = -1, c_2 = -10$$
  
 $a_1a_2 + b_1b_2 + c_1c_2 = 7 \times 3 + 5 \times (-1) + 6 \times (-10) = -44 \neq 0$ 

Therefore, the given planes are not perpendicular.

$$\frac{a_1}{a_2} = \frac{7}{3}, \frac{b_1}{b_2} = \frac{5}{-1} = -5, \frac{c_1}{c_2} = \frac{6}{-10} = \frac{-3}{5}$$

It can be seen that,  $\frac{a_1}{a_2} \neq \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$ 

Therefore, the given planes are not parallel.

The angle between them is given by,

$$Q = \cos^{-1} \left| \frac{7 \times 3 + 5 \times (-1) + 6 \times (-10)}{\sqrt{(7)^2 + (5)^2 + (6)^2} \times \sqrt{(3)^2 + (-1)^2 + (-10)^2}} \right|$$
$$= \cos^{-1} \left| \frac{21 - 5 - 60}{\sqrt{110} \times \sqrt{110}} \right|$$
$$= \cos^{-1} \frac{44}{110}$$
$$= \cos^{-1} \frac{2}{5}$$

(b) The equations of the planes are 2x + y + 3z - 2 = 0 and x - 2y + 5 = 0

Here, 
$$a_1 = 2$$
,  $b_1 = 1$ ,  $c_1 = 3$  and  $a_2 = 1$ ,  $b_2 = -2$ ,  $c_2 = 0$   
 $\therefore a_1a_2 + b_1b_2 + c_1c_2 = 2 \times 1 + 1 \times (-2) + 3 \times 0 = 0$ 

Thus, the given planes are perpendicular to each other.

(c) The equations of the given planes are 2x-2y+4z+5=0 and 3x-3y+6z-1=0

Here, 
$$a_1 = 2, b_1 - 2, c_1 = 4$$
 and

$$a_2 = 3, b_2 = -3, c_2 = 6$$
  $a_1a_2 + b_1b_2 + c_1c_2 = 2 \times 3 + (-2)(-3) + 4 \times 6 = 6 + 6 + 24 = 36 \neq 0$ 

Thus, the given planes are not perpendicular to each other.

$$\frac{a_1}{a_2} = \frac{2}{3}, \frac{b_1}{b_2} = \frac{-2}{-3} = \frac{2}{3} \text{ and } \frac{c_1}{c_2} = \frac{4}{6} = \frac{2}{3}$$

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

Thus, the given planes are parallel to each other.

(d) The equations of the planes are 2x - y + 3z - 1 = 0 and 2x - y + 3z + 3 = 0

Here, 
$$a_1 = 2$$
,  $b_1 = -1$ ,  $c_1 = 3$  and  $a_2 = 2$ ,  $b_2 = -1$ ,  $c_2 = 3$   

$$\frac{a_1}{a_2} = \frac{2}{2} = 1$$
,  $\frac{b_1}{b_2} = \frac{-1}{-1} = 1$  and  $\frac{c_1}{c_2} = \frac{3}{3} = 1$ 

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

Thus, the given lines are parallel to each other.

(e) The equations of the given planes are 4x+8y+z-8=0 and y+z-4=0

Here, 
$$a_1 = 4$$
,  $b_1 = 8$ ,  $c_1 = 1$  and  $a_2 = 0$ ,  $b_2 = 1$ ,  $c_2 = 1$   
 $a_1a_2 + b_1b_2 + c_1c_2 = 4 \times 0 + 8 \times 1 + 1 = 9 \neq 0$ 

Therefore, the given lines are not perpendicular to each other.

$$\frac{a_1}{a_2} = \frac{4}{0}, \ \frac{b_1}{b_2} = \frac{8}{1} = 8, \ \frac{c_1}{c_2} = \frac{1}{1} = 1$$
$$\therefore \ \frac{a_1}{a_2} \neq \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$$

Therefore, the given lines are not parallel to each other.

The angle between the planes is given by,

$$Q = \cos^{-1} \left| \frac{4 \times 0 + 8 \times 1 + 1 \times 1}{\sqrt{4^2 + 8^2 + 1^2} \times \sqrt{0^2 + 1^2 + 1^2}} \right| = \cos^{-1} \left| \frac{9}{9 \times \sqrt{2}} \right| = \cos^{-1} \left( \frac{1}{\sqrt{2}} \right) = 45^{\circ}$$

## Question 14:

In the following cases, find the distance of each of the given points from the corresponding given plane.

## **Point Plane**

(a) 
$$(0, 0, 0)$$
  $3x - 4y + 12z = 3$ 

- (b) (3, -2, 1) 2x y + 2z + 3 = 0
- (c) (2, 3, -5) x+2y-2z=9
- (d) (-6, 0, 0) 2x 3y + 6z 2 = 0

Answer

It is known that the distance between a point,  $p(x_1, y_1, z_1)$ , and a plane, Ax + By + Cz = D, is given by,

$$d = \left| \frac{Ax_1 + By_1 + Cz_1 - D}{\sqrt{A^2 + B^2 + C^2}} \right| \qquad \dots (1)$$

(a) The given point is (0, 0, 0) and the plane is 3x - 4y + 12z = 3

$$\therefore d = \left| \frac{3 \times 0 - 4 \times 0 + 12 \times 0 - 3}{\sqrt{(3)^2 + (-4)^2 + (12)^2}} \right| = \frac{3}{\sqrt{169}} = \frac{3}{13}$$

(b) The given point is (3, -2, 1) and the plane is 2x - y + 2z + 3 = 0

$$d = \left| \frac{2 \times 3 - (-2) + 2 \times 1 + 3}{\sqrt{(2)^2 + (-1)^2 + (2)^2}} \right| = \left| \frac{13}{3} \right| = \frac{13}{3}$$

(c) The given point is (2, 3, -5) and the plane is x+2y-2z=9

$$\therefore d = \left| \frac{2 + 2 \times 3 - 2(-5) - 9}{\sqrt{(1)^2 + (2)^2 + (-2)^2}} \right| = \frac{9}{3} = 3$$

(d) The given point is (-6, 0, 0) and the plane is 2x-3y+6z-2=0

$$d = \left| \frac{2(-6) - 3 \times 0 + 6 \times 0 - 2}{\sqrt{(2)^2 + (-3)^2 + (6)^2}} \right| = \left| \frac{-14}{\sqrt{49}} \right| = \frac{14}{7} = 2$$
